

COST-EFFECTIVE STRUCTURAL CULVERT POINT REPAIR

PRESENTED BY WILL LEBLANC & CHRIS BLOUIN

Project Scope

educational sessions

Multiple 24" Diameter x 48" Length Structural Point Repairs to repair offset and disjointed sections of 24" corrugated HDPE Pipe. Problem area was 200' long, and on a 60% grade

Contractor: Drain Masters, Inc. – Anchorage, Alaska

Project Name: Yosemite Drive Drainage Project

Location: Anchorage, Alaska

Equipment Used

- 18"-24" X 48" Flow Through Packer
- 24" X 48" Structural Point Repair – With Winter Hardener
- Air Regulator
- Portable air compressor

Location

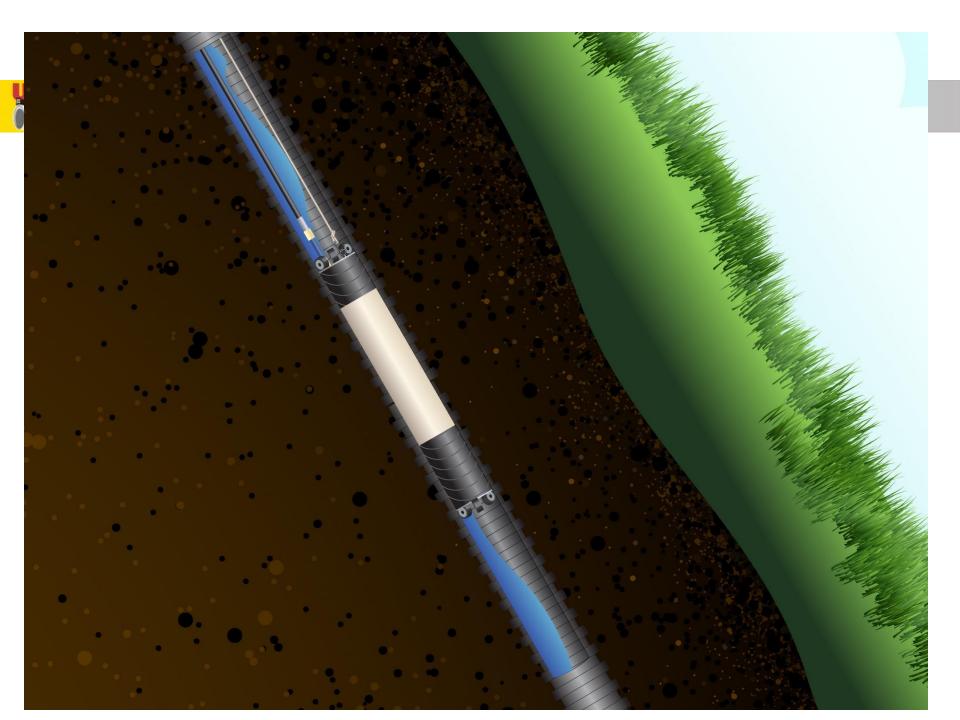

- 200' Section of 24" corrugated HDPE Pipe
- Multiple disjointed and offset joints – 100% water loss over the 200' section.
- 60% grade made open trench repairs unfeasible
- Environmentally sensitive area

Sample of before repair

Protective Sleeve

- Protective sleeve is placed over the packer and secured with vinyl tape
- Sleeve is sacrificial and is discarded after initial trial run

Locate and Measure

 Camera is used to identify, and locate the exact position/distance of the section in need of repair

Transfer Measurement

 Measurement is transferred from the camera to the packer air supply

Trial Run

- A trial run is done to identify any challenges in the placement of the packer
- Initial protective sleeve is discarded and a new protective sleeve is placed on the packer

educational sessions

 Premeasured resin bags are mixed and spread on first side of fiberglass

Flip Fiberglass

Fold Fiberglass to Pre Measured Marks

Roll Fiberglass Around Packer

Secure Fiberglass with Provided Zip Ties

Provided Work Station Used to Cradle Packer to the Pipe educational sessions

Packer is Lowered, Pulled, and/or Pushed into Place

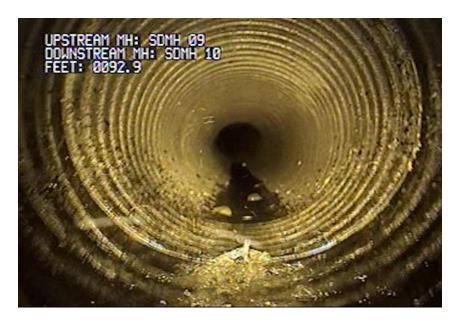

Completiton

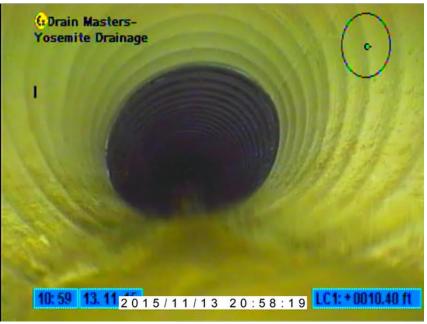

- PSI is maintained during the curing process (1-3 hours)
- After full cure, packer is deflated, and removed
- Final video inspection of repair section is completed.
